ROCKY MOUNTAIN STATION

Central States Forest Experiment Station — U. S. Forest Service  
Technical Paper 166, December, 1959

JOSEPH J. MENDEL began his Forest Service career in 1946 on the Forest Survey of the northeastern states. After 6 years of aerial photo interpretation and field work he was transferred to Washington, D. C. on a special photo interpretation project conducted in cooperation with the U. S. Air Force. Changing assignment but not location in 1957, Mendel worked as an analyst in Foreign Forestry until 1958 when he came to the Central States Station as Forest Survey Representative.

Joe is a native of Wisconsin. He started his undergraduate studies at the University of Wisconsin but received his B.S. in forestry at the University of Michigan. In addition, he did some graduate work in forestry and engineering at the Universities of Michigan and Cincinnati. A veteran, Mendel served nearly 3 years in the army during World War II.

# Veneer-Log Production and Consumption in the Central States 1958

By

Joseph J. Mendel

A slight downturn was noted in the production and consumption of veneer logs in the Central States from 1956 to 1958. Production of veneer logs in 1958 amounted to 52.6 million board feet, a decrease of 3.3 percent from that recorded in 1956. Consumption of veneer logs by the 56 active veneer mills in the Central States amounted to approximately 54 million board feet, a decrease of 7 percent from that of 1956.<sup>1/</sup> The excess of consumption over production, amounting to 1.4 million board feet, is accounted for by an excess of imports into the Central States region over exports.

## Kentucky Leading Producer

Despite the 3.3 percent decrease in the production of veneer logs, the relative status of the producing states or principle species harvested did not change. Kentucky remained the leading producer of veneer logs with nearly one-fourth of the total production in the Central States (table 1). Indiana ranked second, followed by Illinois and Ohio. Missouri and Iowa combined produced one-fourth of the total output.

Black walnut was the principal veneer species harvested in the region, accounting for almost one-third of the total veneer-log production; walnut stumpage harvested was valued at more than \$1,600,000.<sup>2/</sup> Cottonwood, used primarily for container veneer, ranked second in volume produced, accounting for one-fifth of the total production. Other leading species were white oak, yellow-poplar, and red oak, each accounting for 3 million or more board feet. These five species represent 72 percent of the total 1958 production.

---

<sup>1/</sup> One large mill did not report and is excluded from all volume data.

<sup>2/</sup> Calculated on the basis of \$110 per 1,000 board feet. McCauley, Orris D. Forest Products Prices in Ohio-1958. Cent. States Forest Expt. Sta. Tech. Paper 161, 10 pp., illus. 1959.

### Indiana Primary Consumer

Indiana was the leading consumer of veneer logs, using almost half the total Central States consumption (table 2). Illinois, Missouri-Iowa (combined), Kentucky, and Ohio followed in that order, each consuming 10 to 15 percent of the total. Kentucky registered the greatest decline in consumption, principally due to mill closures. Since 1956, five of the ten mills

in Kentucky have gone out of business. Four other mills closed in the Central States: In Ohio, two mills went out of business and one was destroyed by fire; in Indiana, one small mill ceased production. The total active veneer mills in the Central States now number 56 of which approximately 26 are primarily container veneer producers.

Table 2.--Veneer logs consumed at Central States mills in 1958

<sup>1/</sup> International 1/4-inch rule.								
<sup>2/</sup> Combined to avoid disclosure of individual mill data.								
<sup>3/</sup> Logs harvested outside Central States.								

In consumption as well as production, black walnut was the principle species, accounting for almost one-third of the total veneer-logs consumed in Central States mills. Cottonwood ranked second, representing one-fifth of the total consumption; and white oak was third, accounting for more than one-tenth of the total. Combined, these three species represent more than 60 percent of the total veneer-log consumption.

#### Imports Exceeded Exports

Inter-regional movement of veneer logs and imports from foreign countries amounted to 11,228,000 board feet. Incoming shipments from adjoining states and foreign countries totaled 6,333,000 board feet representing more than one-tenth of the total consumption of veneer logs by Central States mills and exceeding outgoing shipments by 1,438,000 board feet. Michigan

and Pennsylvania were the largest suppliers of veneer logs providing 1.7 million and 1.1 million board feet respectively. Other important suppliers were Virginia and West Virginia.

Black walnut accounted for two-fifths of the imports. Cherry, white oak, and red oak each accounted for one-tenth or more of the total imports. Combined these four species represented 77 percent of the incoming veneer logs.

Outgoing shipments of veneer logs grown in the Central States amounted to 4,895,000 board feet or almost one-tenth of the total veneer-log production. West Virginia was the principal recipient of these shipments, receiving half the total. Only two other states received veneer logs from the Central States: Tennessee received 30 percent, and Wisconsin 20 percent of the total. Red oak was the principle component of outgoing shipments amounting to 42 percent of the total. The only other species of significance were yellow-poplar and gum, each of which accounted for 15 percent of the total.

Though no detailed data can be presented, it is estimated, on the basis of species used and knowledge of the various plants, that approximately 60 percent of the veneer logs produced in the Central States went into commercial veneer including face and core stock, and 40 percent were utilized in the production of container veneer.

The data presented in this report are from the second biennial canvass of the veneer industry. Similar canvasses are planned for alternate years to help provide information for the continuing forest survey of the Central States as well as to chart the production and consumption developments of the veneer industry in the Central States.
